

MagicBricks × LeadsDekho

API Integration Guide — Lead Forwarding via HTTP POST

1. Overview

LeadsDekho is the CRM platform used by our sales team to track and act on customer enquiries. To receive MagicBricks leads in real time, we expose a single public HTTP endpoint that accepts lead data as JSON. Every lead posted to this endpoint is stored in a holding queue inside our admin panel — it does **not** appear directly in the sales dashboard. An admin reviews each lead, assigns it to a salesperson, links it to a project, and only then confirms it into the live pipeline. This guide contains everything MagicBricks needs to set up the integration on their side.

2. Endpoint Details

Field	Value
URL	https://leadsdekho.in/api/portal-leads
Method	POST
Content-Type	application/json
Authentication	None (public endpoint)
Response Format	JSON
Timeout	30 seconds recommended

3. Sample Request Body (JSON)

Below is a complete example of a MagicBricks lead payload:

```
{
  "name": "Rahul Sharma",
  "phone": "9876543210",
  "email": "rahul@example.com",
  "source": "MagicBricks",
  "budget": "50-75 Lakhs",
  "projectName": "3BHK Skyline Residency",
  "notes": "Looking for ready-to-move 3BHK in Whitefield, near metro",
  "portalRef": "MB-5839201"
}
```

Only **name** and **phone** are mandatory. All other fields are optional but recommended — richer payloads allow our sales team to qualify leads faster and reduce customer wait time.

4. Field Mapping (MagicBricks → LeadsDekho)

MagicBricks Field	Our API Field	Required	Notes
Customer Name	name	Yes	Full name of enquirer
Mobile Number	phone	Yes	10-digit Indian mobile, no country code
Email	email	No	If absent, omit the field or send empty string
Source Portal	source	No	Send literal value: MagicBricks
Budget	budget	No	Free-form text, e.g. "50-75 Lakhs"
Project / Property	projectName	No	Property name or project mentioned
Requirement / Message	notes	No	Customer's verbatim requirement text
MagicBricks Lead ID	portalRef	Recommended	Unique ID — used to detect duplicate submissions

5. Accepted Field Name Aliases

Our endpoint is forgiving on field names. MagicBricks can use whichever convention matches their internal schema — the table below lists all accepted variants (case-insensitive).

Logical Field	Accepted JSON Keys (case-insensitive)
Name	name, lead_name, customerName, customer_name
Phone	phone, number, mobile, contact, mobileNumber, phone_number, mobile_number
Email	email, mail, mailId, mail_id, emailId, email_id
Source	source, portal, lead_source, portal_name, leadSource
Budget	budget, budget_range, budgetRange
Notes	notes, message, requirement, comment, description
Project	projectName, project, project_name, propertyName, property_name
Portal Ref	portalRef, ref, lead_id, leadId, reference, reference_id, external_id

6. Response Codes

HTTP Status	When	Response Body
201	Lead accepted into pending queue	{ "id": "...", "status": "pending", "message": "..." }
400	Missing name or phone	{ "error": "Both 'name' and 'phone' are required" }
409	Duplicate (same phone + portalRef pending)	{ "error": "Duplicate", "message": "..." }

HTTP Status	When	Response Body
500	Server error (rare)	{ "error": "Internal server error" }

7. End-to-End Integration Flow

- **Customer** submits an enquiry on MagicBricks.
- **MagicBricks** sends the lead via HTTP POST to our endpoint in real time.
- Our system stores the lead in the **PortalLead holding table** with status = pending.
- The lead does **not** appear in the sales dashboard at this stage.
- Our **admin** opens the Portal Leads section, reviews the enquiry, assigns a salesperson and a project, then confirms.
- On confirmation, the lead is promoted into the main Lead table and becomes visible to the assigned salesperson.
- A timeline event is recorded automatically on the lead for audit purposes.

8. Important Notes for MagicBricks

- **Real-time forwarding** is preferred. Leads should be posted within 60 seconds of customer submission.
- **Always send portalRef** (MagicBricks Lead ID). Without it we cannot detect duplicate submissions and the same lead may be imported twice.
- **Phone format**: 10-digit Indian mobile, no +91 prefix, no spaces or hyphens. Example: 9876543210.
- **Send a test lead first**. After integration is live, please send one test lead with a dummy name (e.g. "TEST MB Integration") and share the response so we can verify at our end.
- **Idempotency**: If MagicBricks retries the same request (same phone + portalRef), we return 409 and skip — no duplicate is created. Safe to retry.
- **No authentication** is required currently. If MagicBricks policy mandates an API key or bearer token, please let us know and we will add it within one business day.
